Tangent Theorem: The tangent line (or segment, or ray) is
$\qquad$ to the $\qquad$ of the circle at the point of tangency. (Use this to solve right triangle problems with circles.)

Refer to $\odot \mathrm{C}$ with tangent $\overline{\mathrm{AB}}$.
Find x .
$\mathrm{x}=$ $\qquad$

Equivalent Tangent Theorem: If two segments from the same $\qquad$ point are tangent to a circle, then they are $\qquad$ .

Find x .
$\mathrm{x}=$ $\qquad$

When circles are inscribed in polygons, the polygons are said to be $\qquad$ polygons. In such polygons, each side is $\qquad$ to the circle.
$\triangle T R W$ is circumscribed about $\odot$ A. If the perimeter of $\triangle T R W$ is $50, T K=3$, and $W M=9.5$, find TR.

TR = $\qquad$

If two $\qquad$ angles of a circle or congruent circles intercept congruent arcs or the same arc, then the angles are $\qquad$ _.

In circle $Q, m \overparen{S T}=68^{\circ}$.
Find the $\mathrm{m} \angle 1$ and $\mathrm{m} \angle 2$.
$\mathrm{m} \angle 1=$ $\qquad$
$\mathrm{m} \angle 2=$ $\qquad$

If an inscribed angle of a circle intercepts a angle.

Find x .
$\mathrm{x}=$ $\qquad$

If a quadrilateral is inscribed in a circle, then its $\ldots$ angles are $\qquad$ .

Quadrilateral QRST is inscribed in circle $C$. If $m \angle T=105^{\circ}$ and $\mathrm{m} \angle \mathrm{S}=97^{\circ}$, find $\mathrm{m} \angle \mathrm{Q}$ and $\mathrm{m} \angle \mathrm{R}$.
$\mathrm{m} \angle \mathrm{Q}=$ $\qquad$
$\mathrm{m} \angle \mathrm{R}=$ $\qquad$
